

The LoRa Gateway Mesh – Physical Path

How a message travels from one Yaoundé neighborhood to another with no SIM card, no mobile internet, and no airtime credit — relayed hilltop to hilltop over long-range radio.

A message hops Bluetooth → LoRa → LoRa → Bluetooth across three hilltop gateways, arcing above the terrain that blocks a direct line of sight. The payload is encrypted end-to-end — gateways relay it but can't read it — and no cellular tower is involved at any point.
